Sprint 3 Obstacles/Issues

Fortunately, our group did not run into any major difficulties during sprint 3. The biggest issue was that none of us had any previous experience writing creating a .rst file, but collectively we were able to work together to all become familiar with .rst and create our documentation in this format.

After creating our .rst documentation files which document how a user is able to get an AWS EC2 instance up and running as well as connected to, each of us tested our documentation by following these steps as if we had no prior knowledge and ensuring that the outcome was as expected. Each of these tests was successful, so we are very content with the current status of our documentation

Sprint 4 Goals

- Complete the documentation for setting up the Amazon EC2 instance and installing Augur's dependencies
- Work on the installation script for installing Augur's dependencies
- Continue to manage time wisely and stay ahead of schedule for the project so that it is not necessary to rush to finish the sprint, which allows the highest quality of work to be created
- Edit the script when setting up augur. We want to edit this script to show the password entered when linking the database because right now it can be unclear on what you typed & only gives you one chance at entering the password.
